## WAMC Lesson Plan

Annual percentage yield (APY)	
Questions to Develop Mathematical Thinking: To make a million, start with \$900,000. How might these words apply to what you have learned in this class?	Common Misconceptions: THERE IS ONLY ONE TYPE OF GROWTH

Assessment (Formative and Summative): formative

- Compounding interest work sheet attached

Materials:

- Calculator for each student
- Overhead projector and pens
- Discussion sheet 1,2 and 3

Instruction Plan:

Launch:

Tell the students that this lesson will focus on saving: what it is, why people save, and how interest is calculated on money saved. Many financial experts think Americans save too little. The U.S. Bureau of Labor Statistics reports that we spend (consume), on average, 97 percent of our disposable income (after-tax income). In other words, we save only three percent of our disposable income

Explore:

Show Discussion 1

Explain that disposable income equals consumption plus savings. Point out that for younger students disposable income might include money from an allowance, money received as a gift or money earned for doing jobs at home or in the neighborhood. Explain that consumption is spending on goods and services. Define saving by explaining that saving equals disposable income minus consumption

Show Discussion 2

Explain the Simple Interest Adds column and the Compound Interest Adds column.

<https://wa-appliedmath.org/>

When I observe students:

- Look for engagement

## WAMC Lesson Plan

- Try to incorporate the whole class in the discussion.

Questions to Develop Mathematical Thinking as you observe:

- How long will it take to double the money in your pocket at 2% interest compounded daily?

Answers: answers will vary

Summarize:

Ask:

What is saving?

Saving is disposable income minus consumption.

Remind the students that there are several reasons for saving, such as saving to make a large purchase, saving for emergencies or saving to pay for a college education. These reasons encourage many people to get an early start on saving.

2. Pose a practice problem for use with the simple-interest formula. Initial savings are \$1,000; the interest rate is 5 percent. If you keep the initial savings for five years, how much simple interest will be paid?

$\$1,000 \times 5\% = \$50$  per year;  
 $\$50 \times 5 \text{ years} = \$250$

3. Pose a practice problem for use with the Rule of 72.

Initial savings are \$500. At an interest rate of 3 percent, how long would it take to double your initial savings?

$72 \text{ divided by } 3 = 24 \text{ years}$

Career Application(s):

- **Loan officer:** Usually works at a bank dealing with customers who are interested in borrowing money for cars, homes, home improvements, etc. Needs to know how to calculate interest in order to inform the customer how much money will need to be paid back to the bank each month to satisfy the loan.
- **Credit card company employee:** Needs to know how to calculate interest so when customers buy something with the credit card, they can charge the customer that amount above the cost of the purchase. Most credit card companies have computer programs that will calculate this for them, but knowledge of this calculation helps when speaking to customers.
- **Car salesman:** Needs to know how to calculate interest in case a customer asks for clarification on his or her bills. Even though most computer programmers calculate this automatically, the salesman needs to know how this amount is calculated so that he can answer any questions the customer will have.

21<sup>st</sup> Century Skills and Interdisciplinary Themes:

# WAMC Lesson Plan

21st Century Interdisciplinary themes (Check those that apply to the above activity.)

- Global Awareness       Financial/Economic/Business/Entrepreneurial Literacy       Civic Literacy  
 Health/Safety Literacy       Environmental Literacy

21st Century Skills (Check those that students will demonstrate in the above activity.)

## LEARNING AND INNOVATION

### Creativity and Innovation

- Think Creatively  
 Work Creatively with Others  
 Implement Innovations

### Critical Thinking and Problem Solving

- Reason Effectively  
 Use Systems Thinking  
 Make Judgments and Decisions  
 Solve Problems

### Communication and Collaboration

- Communicate Clearly  
 Collaborate with Others

## INFORMATION, MEDIA & TECHNOLOGY SKILLS

### Information Literacy

- Access and Evaluate Information  
 Use and manage Information

### Media Literacy

- Analyze Media  
 Create Media Products  
Information, Communications and Technology (ICT Literacy)

- Apply Technology Effectively

## LIFE & CAREER SKILLS

### Flexibility and Adaptability

- Adapt to Change  
 Be Flexible

### Initiative and Self-Direction

- Manage Goals and Time  
 Work Independently  
 Be Self-Directed Learners

### Social and Cross-Cultural

- Interact Effectively with Others  
 Work Effectively in Diverse Teams

## Productivity and

### Accountability

- Manage Projects  
 Produce Results

### Leadership and

### Responsibility

- Guide and Lead Others  
 Be Responsible to Others

## Interest Earned on an Initial \$100 Saved at 8%

# Washington

## Interest Rate

Year	Simple Interest Adds	Total Saving Using Simple Interest	Compound Interest Adds	Total Saving Using Compound Interest
1	\$8.00	\$108.00	\$8.00	\$108.00
2	8.00	116.00	9.00	117.00
3	8.00	124.00	9.00	126.00
4	8.00	132.00	10.00	136.00
5	8.00	140.00	11.00	147.00
6	8.00	148.00	12.00	159.00
7	8.00	156.00	12.00	171.00
8	8.00	164.00	14.00	185.00
9	8.00	172.00	15.00	200.00

*Note: All numbers are rounded using the previous number as the base.*

## THE RULE OF 72

The Rule of 72 is a simple way to illustrate the magic of compound interest.

72 divided by the Rate (of interest being paid on savings) = the number of years it will take for savings to double when interest is allowed to compound.

The Rule of 72 illustrates how compound interest doubles savings more quickly than simple interest.

Example: Compound Interest at 8% for 9 years

72 divided by 8% = 9 years

At the end of nine years, the initial savings of \$100 have increased to

\$200 — double the amount of initial savings.

## Quiz Compounding Interest

### Multiple-Choice Questions

1. Which of the following is the best definition of saving?
  - a. The discount received from buying something on sale
  - b. Disposable income minus consumption spending
  - c. Putting your money under your mattress
  - d. The interest paid on a savings account
  
2. Which of the following is a reason to save?
  - a. Your parents place a dollar into your savings for every dollar you save.
  - b. The penalty for taking your savings out of the bank
  - c. Not being able to buy something right now
  - d. Having to go to the bank before making a purchase
  
3. If you have \$50 in savings for one year at an interest rate of 6 percent, how much interest will you earn at the end of the year?
  - a. \$5
  - b. \$4
  - c. \$3
  - d. \$2
  
4. If you divide the interest rate paid on savings into 72, the result tells you how many years it will take for your savings to double if you receive compound interest. At a compound interest rate of 10 percent, how many years will it take to double your money?
  - a. 2.7 years
  - b. 7.2 years
  - c. 7.0 years
  - d. 10.0 years

### Essay Question

1. Explain in your own words what this statement means:

“Pay yourself first.”

[www.wa-appliedmath.org/](http://www.wa-appliedmath.org/)

## Answer Key

1. b. Disposable income minus consumption spending
2. a. Your parents place a dollar into your savings for every dollar you save.
3. c. \$3
4. b. 7.2 years
5. Paying yourself first means making saving a priority over spending. The decision on how much to save is made before the decision on how much to spend on consumption. Paying yourself first allows a person to more easily achieve goals for saving.
